The research provides findings from an experimental survey on the reproductive health project in Nghe An province, Viet Nam (1995-2005) by the Japan International Cooperation Agency (JICA). The main objective of the project was to evaluate if there were improvements in the reproductive health care services using the observations at facilities during 2001-2005. The results of the survey show that the situation of facilities in 2005 was better than that in 2001. The project indeed had good impacts on the reproductive health situation in Nghe An province.
